First-time assembler usability review

Status: prepared, not conducted. Guide: 200 Mod, Revision 1 · October 30, 2026.

Device/browser: _____ Date: _____ Participant familiarity: _____
Consent to record observations: _____ Facilitator: _____

Facilitator instructions

Test the guide, not the participant. Invite someone unfamiliar with Abstracta to think aloud. Present one task at a time without coaching, pointing to controls or correcting interpretations. Record the first action, exact questions, hesitation and mistakes. Ask “What would you do next?” Record any later assistance separately. Do not request physical lifting, hammering or loading during this comprehension review. Suggested duration: 20–30 minutes.

Task	First action / time	Hesitation, error or exact words	Assistance	Proposed revision
Identify the tube, connector types and tools needed for the first bone.				
Find bone B on the plan; explain the direction of its unused prongs.				
Start the step, slow it down, pause and scrub to inspect a connection.				
Explain how the receiving bone moves when joining a pair of tubes.				
Open full screen, exit, then explain whether progress was retained.				
Mark a completion check, leave/reload the page, and resume the assembly.				
Find the correct 620 corner placement and explain the missing-bumper example.				
Switch to still instructions and identify all four bumpers before glass.				
Use final inspection focus; explain what checking a box does and does not verify.				
Explain the next assembly action and how to print the current checklist.				

Debrief

What required the most interpretation? Where did the guide differ from expectation? Was it clear when to check orientation and support? What would help beside the physical unit?

Notes: _____

_____

Save actual observations in a separate dated report. This blank review sheet contains no participant results and does not establish manufacturer or structural approval.
